

Time API

Common provisions

Terminology

The terminology of [RFC 2119](#) (specifically **must**, **should**, **may** and their negatives) applies. The word **will**, when applied to the Service API, has the same meaning as **must**.

Protocol

The API supports communication over HTTP only.

Endpoints

Now

This endpoint can be called to check the current server time

Query String

The client **must** submit a request to the endpoint `/now`.

Request

The client **must** submit a request body with a GET method:

```
GET /now HTTP/1.1
Host: time.env.fathomai.com
```

Responses

The Service **will** respond with HTTP Status `204 No Content`, with an empty body, and with a response header `X-Time` containing the current time in unix timestamp format:

```
HTTP/1.1 204 No Content
Server: nginx/1.15.0
Date: Tue, 12 Jun 2018 20:44:53 GMT
Connection: keep-alive
X-Time: 1528836293
```
